Yale New Haven Health

Background

- Multiple Sclerosis (MS), a debilitating, chronic disease of the central nervous system, is the most common cause of neurological defects in young adults, affecting more than 2.3 million people worldwide.
- There are currently over a dozen disease-modifying therapies (DMTs) that reduce relapse rates and slow disease progression.
- Despite positive efficacy studies, there are many barriers to medication adherence, which may impact patient outcomes.

Objective

- Evaluate the correlation between medication adherence and clinical outcomes and to identify barriers to adherence in the MS patients filling DMT prescriptions at Outpatient Pharmacy Services at Yale New Haven Health (YNHHS OPS).

Methods

- Retrospective, descriptive study of patients diagnosed with MS
- Inclusion Criteria: Adult patients filling MS medications at YNHHS OPS in Hamden, CT between January 1, 2018 to July 31, 2018.
- Exclusion Criteria: Patients no longer filling with YNHHS OPS, or not having had >1 fill of DMT
- Subjective adherence outcomes were obtained through semi-annual MS Patient Clinical Follow Up assessments conducted by a specialty pharmacist.
- Demographic information, laboratory values, and history were collected from the pharmacy dispensing system, and hospital admissions obtained through the system-wide electronic health record (EHR).
- Analyses were performed with R Studio Team (2016). RStudio: Integrated Development for R. RStudio, Inc., Boston, MA
- Correlational analyses identified associations of patient factors and medication adherence and the correlation of medication adherence and clinical outcomes.
- Chi-squared test was utilized to compare nominal variables and t-test was used to compare continuous variables.

Results

Study Inclusion:

<table>
<thead>
<tr>
<th>Characteristic</th>
<th>n(%), Patient Characteristics</th>
</tr>
</thead>
<tbody>
<tr>
<td>MPR &gt; 80%</td>
<td>138 patients included</td>
</tr>
<tr>
<td>MPR = 60% - 80%</td>
<td>14 patients missed for eligibility</td>
</tr>
<tr>
<td>MPR &lt; 60%</td>
<td>26 patients missed for eligibility</td>
</tr>
</tbody>
</table>

- 138 patients included

- 26 patients excluded: 8 patients opted out of YNHHS OPS counseling, 5 patients opted out of infusion therapy, 2 patients discontinued DMT, and 3 patients no longer filling with YNHHS OPS

Correlation Analysis of Medication Adherence Factors and Clinical Outcomes

- A weak, but statistically significant, correlation (p < 0.05) was identified between worsening adherence and increasing hospital admission or ED visits due to MS.
- There was no significant correlation found for additional factors.

Discussion

- A total of 138 patients were included in the analysis.
- Adherence results found that 3.6% (5/138) of patients had a MPR < 80%, 15.2% (21/138) had a MPR < 90%, and 29% (40/138) of patients subjectively reported missing a dose of medication in the last 4 weeks.
- In patients with a MPR > 90% compared to a MPR < 90%, all patient characteristics were not significantly different between each group with the exception of BMI (p=0.05).
- A weak, but statistically significant, correlation (p < 0.05) was identified between patients with a diagnosis of depression and patients with an MPR < 80%, suggesting a weak correlation between worsening adherence and increasing depressive symptoms.
- There was not a significant correlation found for additional factors.

Conclusions

- Patients who were not adherent to DMTs were associated with a higher rate of hospital admissions or ED visits due to MS symptoms documented in the EHR.
- The importance of mental health for patients should be emphasized in this population as increasing depression symptoms was correlated with decreasing medication adherence.
- Although medication frequency, route, cost, and individual patient factors should be considered when selecting a medication, there was not a correlation between these factors and medication adherence in our patient population.

Future Directions

- Further initiatives investigating how to improve patient adherence should be conducted.
